1155  \( \beta \)-COP is essential for transport of protein from the endoplasmic reticulum to the Golgi in vitro.

1169 Prohormone processing in the trans-Golgi network: Endoproteolytic cleavage of prosomatostatin and formation of nascent secretory vesicles in permeabilized cells.
H. Xu and D. Shields

1185 Oligomerization of a membrane protein correlates with its retention in the Golgi complex.
O. A. Weisz, A. M. Swift, and C. E. Machamer

1197 Microtubule independent vesiculation of Golgi membranes and the reassembly of vesicles into Golgi stacks.
B. Veit, J. K. Yucel, and V. Malhotra

1207 Synaptic vesicle proteins and early endosomes in cultured hippocampal neurons: Differential effects of brefeldin A in axon and dendrites.
O. Mundigl, M. Matteoli, L. Daniell, A. Thomas-Reetz, A. Metcalf, R. Jahn, and P. De Camilli

1223 Bidirectional transcytosis determines the steady state distribution of the transferrin receptor at opposite plasma membrane domains of BeWo cells.
D. P. Cerneus, G. J. Strous, and A. van der Ende

1231 The End2 mutation in CHO cells slows the exit of transferrin receptors from the recycling compartment but bulk membrane recycling is unaffected.

1243 Two steps of insulin receptor internalization depend on different domains of the \( \beta \)-subunit.

1255 GPI- and transmembrane-anchored influenza hemagglutinin differ in structure and receptor binding activity.
G. W. Kemble, Y. I. Henis, and J. M. White

1267 Protein denaturation in intact hepatocytes and isolated cellular organelles during heat shock.
J. R. Lepock, H. E. Frey, and K. P. Ritchie

1277 Three-dimensional solution structure of Acanthamoeba profilin-I.

1285 Suppression of vinculin expression by antisense transfection causes changes in cell morphology, motility, and anchorage-dependent growth of 3T3 cells.
J. L. Rodriguez Fernandez, B. Geiger, D. Salomon, and A. Ben-Ze'ev

1295 Synchrony of cell spreading and contraction force as phagocytes engulf large pathogens.
E. Evans, A. Leung, and D. Zhelev

1301 Chaperonin-mediated folding of vertebrate actin-related protein and \( \gamma \)-tubulin.
R. Melki, I. E. Vainberg, R. L. Chow, and N. J. Cowan

1311 Differential expression of a phosphoepitope at the kinetochores of moving chromosomes.
G. J. Gorbsky and W. A. Ricketts

1323 Assembly of type IV neuronal intermediate filaments in nonneuronal cells in the absence of preexisting cytoplasmic intermediate filaments.
G. Y. Ching and R. K. H. Liem

1337 Neurofilaments are obligate heteropolymers in vivo.
M. K. Lee, Z. Xu, P. C. Wong, and D. W. Cleveland

Contents continued

Cover picture: Ribbon diagram of the solution structure of Acanthamoeba profilin I as determined by NMR spectroscopy. Strands that make up \( \beta \)-sheet structure are colored yellow and \( \alpha \)-helical segments are colored purple. The central antiparallel \( \beta \)-sheet is flanked by two helices on one side and a third helix and a short \( \beta \)-sheet on the other side. See related article in this issue by Vinson et al., 1277-1283.
Subtractive immunization yields monoclonal antibodies that specifically inhibit metastasis.

Structure/function analysis of the integrin β1 subunit by epitope mapping.
